True/False

The two loops print the same number of lines:

```
1 | int i = 0;  
2 | while (i < 5) {  
3 |     System.out.println();  
4 |     i++;  
5 | }
```

```
1 | int j = 0;  
2 | for (; j < 5; j++) {  
3 |     System.out.println();  
4 | }
```

True/False

The two loops print the same number of lines:

```
1 | int i = 0;
2 | while (i < 5) {
3 |     System.out.println();
4 |     i++;
5 | }
```

```
1 | int j = 0;
2 | for (; j < 5; j++) {
3 |     System.out.println();
4 | }
```

True

True/False

This is a valid Java statement:

```
1 | int [] [] [] array = new int [] [] [] ;
```

True/False

This is a valid Java statement:

```
1 | int [] [] [] array = new int [] [] [] ;
```

False

```

False

This is a valid Java statement:

```
1 | int [] [] [] array = new int [3] [] [] ;
```

True/False

This is a valid Java statement:

```
1 | int [][] [] array = new int [][] [] ;
```

False

This is a valid Java statement:

```
1 | int [][] [] array = new int [3] [][] ;
```

True

Multiple Choice

What is the value of k at the end?

```
1 | int[] array = { 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 };
2 | int k = 0;
3 | for (; k < array.length; k++) {
4 |     k += array[k];
5 | }
```

1. 10
2. 11
3. 15
4. 55

Multiple Choice

What is the value of k at the end?

```
1 | int[] array = { 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 };
2 | int k = 0;
3 | for (; k < array.length; k++) {
4 |     k += array[k];
5 | }
```

1. 10
2. 11
3. 15
4. 55

Multiple Choice

Select the assertions that are true after execution of the following method:

```
1 public static void main(String[] args) {  
2     String s1 = Hello World ;  
3     String s2 = s1;  
4     String s3 = new String(s1);  
5 }
```

1. `s1 == s2`
2. `s2 == s3`
3. `s1.equals(s2)`
4. `s2.equals(s3)`
5. Error

Multiple Choice

Select the assertions that are true after execution of the following method:

```
1 | public static void main(String[] args) {  
2 |     String s1 = Hello World ;  
3 |     String s2 = s1;  
4 |     String s3 = new String(s1);  
5 | }
```

1. `s1 == s2`
2. `s2 == s3`
3. `s1.equals(s2)`
4. `s2.equals(s3)`
5. Error

Multiple Choice

What is printed after the following code is executed?

```

1  public static void main(String[] args) {
2      Robot chell = new Robot();
3      String s = "hello human";
4      chell.cake(s);
5      System.out.print(s + " " + chell.s);
6  }
7  public Robot() {
8      String s = "I have a cake";
9      public void cake(String s) {
10         this.s = "cake is a lie";
11         s = "bye human";
12     }
13 }
```

Multiple Choice

1. "hello human cake is a lie"
2. "hello human I have a cake"
3. "cake is a lie I have a cake"
4. "bye human I have a cake"
5. "hello human bye human"

Fill in the blanks

Solution:

```
1 | boolean isSorted(int[] array) {  
2 |     for (int i = 1; i < array.length; i++)  
3 |         if (array[i] < array[i - 1]) {  
4 |             return false;  
5 |         }  
6 |     return true;  
7 | }
```

Fill in the blanks

Fill in the following function:

```

1  boolean isPalindrome(int[] array) {
2      // Returns: true if the array is a palindrome
3
4      int lower = ___, upper = ___;
5
6      while (___) {
7          if (array[lower] != array[upper]) {
8              return false;
9          }
10         lower++;
11         upper--;
12     }
13
14     return true;
15 }
```

Fill in the blanks

Solution:

```

1  | boolean isPalindrome(int[] array) {
2  |     int lower = 0, upper = array.length - 1;
3  |
4  |     while (lower <= upper) {
5  |         if (array[lower] != array[upper]) {
6  |             return false;
7  |         }
8  |         lower++;
9  |         upper--;
10 |     }
11 |
12 |     return true;
13 | }
```

Fill in the blanks

Fill in the following function:

```

1  boolean hasPalindrome(int[] array, int length) {
2      // Returns: true if array contains a palindrome
3      // of length at least i
4
5      for (int i = 0; i <= ____; i++) {

2 | c.static_method();

```

1. Class's method is called
2. Subclass's method is called
3. Compile-time error
4. Run-time error

General Rule

In general, if we define a variable `var` as such:

```

1 | // S and D are predefined classes
2 | S var = new D();
3 | S.X;
```

Then `S` is the **static type** of `var` and `D` is the **dynamic type** of `var`. If we attempt to access a field or method of `var`, which one is called?

- If `X` is a **field**, the field from the **static type** of `var` will be used.
- If `X` is a **method**, then it depends on whether or not it is static:
 - If `X` is a **static method**, then the method from the **static type** of `var` will be used
 - If `X` is a **non-static method**, then Java will use dynamic method lookup to determine which class's method to call, starting from the lowest class in the hierarchy.

Important: `D` must be either a child class of or equal to `S`, or it is a compile-time error.

Fields

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A field `x` from Subclass?
- A field `x` from Class?

```

○○
○○○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
●○○

```

```

○○○

```

```

○
○○○○

```

Fields

If we have an object of type Subclass that extends Class:

```
1 | Subclass s = new Subclass();
```

How can we access...

- A field `x` from Subclass?

```
1 | s.x;
```

- A field `x` from Class?

```

○○
○○○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
●○○

```

```

○○○

```

```

○
○○○○

```

Fields

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A field x from Subclass?

```

1 | s.x;

```

- A field x from Class?

```

1 | Class c = s;
2 | c.x;

```

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
●○○

```

```

○○○

```

```

○
○○○○

```

Fields

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A field `x` from Subclass?

```

1 | s.x;

```

- A field `x` from Class?

```

1 | Class c = s;
2 | c.x;

```

Alternatively, we can cast our variable:

```

1 | ((Class) s).x;

```

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●○

```

```

○○○

```

```

○
○○○○

```

Static Methods

If we have an object of type Subclass that extends Class:

```
1 | Subclass s = new Subclass();
```

How can we access...

- A static method `f()` from Subclass (without calling `Suclass.f()`)?
- A static method `f()` from Class (without calling `Class.f()`)?

```

○○
○○○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●○

```

```

○○○

```

```

○
○○○○

```

Static Methods

If we have an object of type Subclass that extends Class:

```
1 | Subclass s = new Subclass();
```

How can we access...

- A static method `f()` from Subclass (without calling `Suclass.f()`)?

```
1 | s.f();
```

- A static method `f()` from Class (without calling `Class.f()`)?

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●○

```

```

○○○

```

```

○
○○○○

```

Static Methods

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A static method `f()` from Subclass (without calling `Suclass.f()`)?

```

1 | s.f();

```

- A static method `f()` from Class (without calling `Class.f()`)?

```

1 | Class c = s;

```

```

2 | c.f();

```

Static Methods

If we have an object of type Subclass that extends Class:

```
1 | Subclass s = new Subclass();
```

How can we access...

- A static method `f()` from Subclass (without calling `Suclass.f()`)?

```
1 | s.f();
```

- A static method `f()` from Class (without calling `Class.f()`)?

```
1 | Class c = s;
2 | c.f();
```

Again, we can simply cast our variable:

```
1 | ((Class)s).f();
```

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●

```

```

○○○

```

```

○
○○○○

```

Non-static Methods

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A non-static method `f()` from Subclass, assuming that the method is defined in both Class and Subclass?
- A non-static method `f()` from Class, assuming that the method is defined in both Class and Subclass?

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●

```

```

○○○

```

```

○
○○○○

```

Non-static Methods

If we have an object of type Subclass that extends Class:

```

1 | Subclass s = new Subclass();

```

How can we access...

- A non-static method `f()` from Subclass, assuming that the method is defined in both Class and Subclass?

```

1 | s.f();

```

- A non-static method `f()` from Class, assuming that the method is defined in both Class and Subclass?

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○●

```

```

○○○

```

```

○
○○○○

```

Non-static Methods

If we have an object of type Subclass that extends Class:

```
1 | Subclass s = new Subclass();
```

How can we access...

- A non-static method `f()` from Subclass, assuming that the method is defined in both Class and Subclass?

```
1 | s.f();
```

- A non-static method `f()` from Class, assuming that the method is defined in both Class and Subclass?

This is impossible! This is a feature of Java, not a bug. When you override a non-static method in your parent class, you are specifying a *more specific* action for your subclass to take. If you require the original behaviour of the parent class's method, it is much better design to create another method.

Stack and Heap Diagrams

Draw a picture of what memory looks like when execution reaches the commented line:

```

1  class Foo {
2      int[] x;
3      String s;
4
5      public void bar(int x, Foo f) {
6          this.x[x] = x;
7          f.s = this.s;
8          if (f.s != null) {
9              // Draw what memory looks like here!
10         } else {
11             s = "herp derp";
12             f.bar(++x, this);
13         }
14     }
15
16     public static void main(String[] args) {
17         Foo f = new Foo();
18         f.x = new int[4];
19         f.bar(2, f);
20     }
21 }
```

```

Short Answer

How can you test if Java's implementation of `LinkedList` is singly linked or doubly linked? Assume that you only have one method:

```
Object get(int index)
```

which returns the element at index `index`.

```

○○
○○○○○○○○○○○○○○
○○○○○○○○
○○○○○

```

```

○○
○○○○○○○
○
○○○

```

```

○○○

```

```

○
●○○○

```

Cyclic Linked Lists

Complete the method for detecting if a singly linked list has a cycle:

```

1  public static boolean containsCycle(SList myList){
2      SListNode a = myList.head;
3      SListNode b = myList.head;
4
5      /*
6       * Your code goes here. Available SListNode
7       * instance variables: next, item.
8       */
9  }
```

Cyclic Linked Lists

Solution:

```

1  public static boolean containsCycle(SList myList){
2      SListNode a = myList.head;
3      SListNode b = myList.head;
4
5      while((a.next != null) && (b.next != null)){
6          a = a.next;
7          b = b.next;
8          if(b.next != null){
9              b = b.next;
10         }
11
12         if(a == b){
13             return true;
14         }
15     }
16
17     return false;
18 }
  
```

Reversing Linked Lists

Complete the method for reversing a doubly-linked non-circular tailless linked list

```

1  public static void reverse(DList myList){
2      DListNode b = myList.head;
3      DListNode c = myList.head;
4      /*
5         * Your code goes here. Available DListNode
6         * instance variables: next, prev.
7         */
8  }
```

Reversing Linked Lists

Solution:

```

1  public static void reverse(DList myList){
2      DListNode b = myList.head;
3      DListNode c = myList.head;
4
5      while(c.next != null){
6          c = c.next;
7          b.next = b.prev;
8          b.prev = c;
9          b = c;
10     }
11     this.head = b;
12 }
```
